And what happens, then, if you comment the lines related to the Delta Mass cut in you file.dec? I see that in PandaRoot, in the file /EvtGen/evt.pdl, there is the possibility to set up a 'max_Dm/GeV'. The command which I suggested you, it allows to set up a min and max mass value. In my case it is taken into account: I just tried and on the prompt I see that the Delta Mass is reset according the the mass values which I just passed by my file.dec, while the sim-macro is running.

If you do not pass any value there, the default value 'max_Dm/GeV' of the dummyXX from the evt.pdl file is supposed to be used.

cheers, Elisabetta
