And what happens, then, if you comment the lines related to the Delta Mass cut in you
file.dec? I see that in PandaRoot, in the file /EvtGen/evt.pdl, there is the possibility to set up a
'max_Dm/GeV'. The command which I suggested you, it allows to set up a min and max mass
value. In my case it is taken into account: I just tried and on the prompt I see that the Delta
Mass is reset according the the mass values which I just passed by my file.dec, while the
sim-macro is running.
If you do not pass any value there, the default value 'max_Dm/GeV' of the dummyXX from the
evt.pdl file is supposed to be used.

cheers, Elisabetta
