Ciao Stefano,

but then I have still particles with a wrong charge which are grouped to the wrong list I have to filter on like Klaus reported earlier in this thread.

The particles with the wrong charge are not just in the wrong list and will be removed due to filtering, they are also missing in the other list, which drops your efficiency (I saw this already, but I had no explanation for that).

I think in combination with the selection criteria this is a lot one needs to know in addition (which is not intuitive) to use the ideal algo correctly and I think the least people which use the Ideal algo know that.

Best Regards

Simone
