I don't think that we have a model for eta' -> dilepton + rho0 in hand. If you use a "generator" model for the dilepton, it does not use the M1-model for Breit-Wigner-sampling of the daughter, but a fixed mass.

PS: if you use "/generator", it does not use the PInclusiveModel as a primary one. Pluto might be confused about this. "/generator" is normally used together with a primary model in weighting mode.
