Stefano Spataro wrote on Thu, 10 October 2013 18:40: Sorry,
what is exactly wrong in these plots? They look fine to me, apart from some high length
background due probably to some propagation/tracking problem.

Well, maybe I misunderstand the flying path after propagation.
That means FairGeanePro only returns the length between last point of helix to EMC hit point,
if yes, those distributions look good.

Here the flying path should be longer than the straight line from vertex to EMC hit position. I
thought it the total length of one track, since I only read the code instead of the document.
