Sorry, off topic. But since there is no general PANDA-related computing forum, I just dump it here.

This morning, we (André+I) created an entry for the PANDA collaboration for the DPG 2014 in Frankfurt.

The basis of this entry was an Excel sheet we got from Jim.

Here's a link to the Python file we used to generate the .tex document:

<https://gist.github.com/Nepomuk/7927919> (also: the required Python LaTeX template file).

Maybe it comes in handy if anyone of you wants to use it for the DPG 2015 .

(There's a look-up table included which converts institute abbreviations to their full names, for

Jülich«. You might need the Python package manager pip installed to get the required packages included in the header (Cheetah, xlrld (, and latexcodec [unused].)
