Hi again,

I switched the fairroot base to v13.12 in order to be able to run simulations with extended target. Since then the problem came back: the MC truth match does not seem to work but in a few events the number of e.g. pions or kaons is larger than it should. Since i thought that the previous version I used when it worked, was v13.05 I switched back to that and recompiled, but the problem remained. Now it came to my mind that the fairrot version may have been a different one - unfortunately I forgot to keep record. Which version should be used?

Cheers,
/Karin
