```
PndKinVtxFitter vtxfitter(etac_vtx[j]);  
vtxfitter.Fit();  
RhoCandidate *etacfit=etac_vtx[j]->GetFit();  
k1 = etacfit->Daughter(0);
```

k1 is fitted or not?

k1 is fitted.

To understand this concept: The decay tree is copied internally. The fitted tree can be accessed via one call of GetFit(). Then you navigate in the fitted tree via Mother/Daughters relations.

Cheers
Ralf
