Subject:  $\pi^0$  in fast simulation

Hi there,

I compared  $p\bar{p} \rightarrow e^+e^-\pi^0$  both in Full and Fast simulation.

Conclusions: the lack of bremsstrahlung and pair production makes electron and  $\pi^0$  resolution a bit too good in my opinion. The problem is that the Full simulation produces a lot of background in the EMC that spoils the resolution and reconstruction of the particles.

See the uploaded pdf file.

Friendly greetings,  
Ronald Kunne
