some thing verbose like will be good in this case I have not seen any loop on verbose in the source code FairPrimaryGenerator.cxx. But one can put the loops like

```
if (verbose>1){  
    cout << "\033[5m\033[31m -W FairPrimaryGenerator: PDG code " << pdgid << " not found in  
    database. This warning can be savely ignored.\033[0m " << endl;  
}
```

Thank you
