Hello Klaus,

I tried the bremsstrahlung for the simulation of the decay:

chi_cj->J/psi gamma

with J/psi->e+e-

I first selected a J/psi from e+e- candidates, and then

I did a 4C fit to the chi_cj candidates.

If I look to the probability of the fit I obtained this distribution:

with a peak at zero.

But when I simulated the same decay mode, using the same macro,
but without the bremsstrahlung, after the 4C fit I obtained this
probability distribution:

uniform distributed from 0 to 1.

Do you have an idea on what's going on?

Thanks

Elisa
