Dear Stefeno,

Thanks for your quick reply and sorry for delay response too. I have used Riemann Track finder earlier to find the tracks with secondary vertices as Tobias suggested to me. but last time it had a crash.the conversation link is below.
https://forum.gsi.de/index.php?t=msg&goto=15515&#msg_15515
Now I have to check it again.

As you suggested for the safety, I could use the ideal pattern recognition.
Is it better then the Riemann Track finder to find the secondary tracks??
Where I can find the Ideal pattern recongnition task? Is it already inside the standard reco macro?
Since I want to be much sure about the better secondary track finder before the generation of Events.

Please give me your valuble suggestion by which I can improve my analysis results.

Thanks in Advance.
