Thank you Stefano. This helps, but does not answer to my question completely.
And my question is:

if I wish to test the pull of the tracking distributions, such as Z0(), Dist(), Radius(), TanL(),
without recalculating in my analysis macro, which are available and I can get from the class
tracking/PndTrkTrack.h, how can I introduce this information in the /macro/reco__complete.C?
Clearly, if the info is not in the macro reco_complete.C, I cannot take it and work on that in a
modified version of macro/pid/track_check.C.

I hope this would explain better my problem.

If anybody has any idea or any macro doing this, please I am interested in that.

Thank you in advance for your help, and have a nice weekend!

cheers,
Elisabetta
