Hi Dima and Stefano,

Error matrix in the construction of neutral candidate has a form with 7X7 matrices in total 3 categories.

I have seen/learn follow setting for neutral cand. with PndPidCandidate.
position error set to be 0.
position-momentum covariance set to be also 0.
momentum(px,py,pz,E) error has been evaluated by module and cluster.

I am wondering the term in position-momentum covariance must be 0 for neutral case? or I am now misunderstanding for this concept.

Best wishes,
Donghee
