Hi,

Typically the histogram with most counts is the correct one, because the others are only filled with random coincidences.

As far as I can see, most counts are in the top-left histogram (channel=0 crystal-id=004) in "agata_pgt_corr_all.png".

Can you choose a different binning, for example 500,0,300:500,600,1000 or even more centered around the spot in the middle 500,100,150:500,800,900? I think you'll be able to see the corellation there.

Michael
