Hi,

this is a problem already known by the ROOT team and fixed in newer ROOT versions. You can find the complete information at http://root.cern.ch/phpBB3/viewtopic.php?f=3&t=17419

To solve the problem please add the following statement

--enable-builtin-freetype

to the configure command in the file tools/rootconfig.sh in the source code of the external packages. After you did this rerun the configure command. With this change you will use the freetype library which comes with ROOT instead of the system one.

Ciao

Florian
