Edit:
I found something strange - when I use primGen->AddTrack - reading root file lead to crash (reading, reconstruction seems to be ok). But after I commented out this part of code, my fTracks branch is filled properly (of course I loose all FairMCTracks).
In root macro reading file crashing when I close TFile (during the reading files I dont get any error).
So It's seems that I can't add my branch if I use AddTrack because something wrong will happen with my data - but I don't kwno why.
