Hi Alexandros,

 if I understood well your question, you are looking for something like in /tutorial/rho/tut_ana.C

```
        for (j=0;j<jpsi.GetLength();++j)
        {
            if (theAnalysis->McTruthMatch(jpsi[j]))
              {
                    hjpsim_reco->Fill( jpsi[j]->M() );
                    hjpsim_true->Fill( jpsi[j]->GetMcTruth()->M();
              }
        }
```

Here the example is related to the J/psi mass, reconstructed through pi+ pi-. jpsi = name of the combined list pi+ + pi-. hjpsim_reco and hjpsim_true are 2 histograms.
Is this what you asked?

[...there are never stupid questions)

cheers, Elisabetta
