Hi Tayfun,

I hope not for the huge shift ^^

I am using the PSA interaction positions. I know it is not optimum at the moment, but it was fine for a rough tuning.

I still have to improve PSA, and get this procedure done again, most probably with a gamma line (which is easier for tuning if statistic is sufficient).

The other solution, is to use the segment center to doppler correct the spectra. I did not try it for X-rays, and I am not sure it is a any helps to have a big error on position to do a fine tuning of the position of the target.

Damian
