Hi all,

I run the new code and compared the results of the standard analysis macro ( $\psi(2S) \rightarrow J/\psi \pi^+ \pi^-$ ), in blue you can see the "old" (february) results and in "red" the new ones.

You can see a bit of increase in efficiency, resolution is consistent. I would say that this version of the tracking code can be used by the analysts and can be included in the release.

Later I will check cleanup.
