Dear Klaus,

Thank you for your quick reply.

As you suggested, I have used the daughter particles of Lambda and Lambdabar to find their real decay vertex. I have plotted Z vs R distribution for final state particles p and pi- or pbar and pi+ respectively for Lambda and Lambdabar. The distribution looks the same but there is a difference in entries for the decay particles. I have attached the pdf file. Please have a look and suggest me if it is wrong.

Thanking you.
