Hello Marcel,

in order to get a fitter work you have to provide your measurement as well as the symmetric covariance matrix. In case of the RhoCandidate and the kinematic fits you need the four-momentum and the 4x4 matrix. The trivial covariance matrices contain the squared errors on the diagonal. You can use `void SetCovP4 ( const TMatrixD& covP4 );` to set it in the candidate.

Cheers  
Ralf

See more on the RhoCandidate in the header:
