Hello.

The binary (FTFGen) is automatically compiled by Pandaroot and is installed in your build/bin directory, next to DPMGen.

I am able to put FtfDirect into the PGen library (now that I sorted out some lib issues).

However, I have trouble to compile with the standalone makefile. The Problem is that the include files are not found. Which environment setup should one have (e.g. Geant4?) to compile Ftf?

Lastly: Is it really necessary to have the standalone compilation? I would agree for a package \_outside\_ of our svn repository.

Cheers!

Ralf
