Dear All,

I have simulated 10^4 events for the signal channel $p\bar{p} \rightarrow D^{*+} D^{*-} \rightarrow D^0 \pi^+ D^0 \pi^-$ while adding Lambda Disks to the rest detector system in the `sim_complete.C` macro. I have observed that with the ideal tracking code (i.e. `recoideal_complete.C`) D^0 ($K^- \pi^+$) and D^{*+} ($D^0 \pi^+$) are not reconstructed but with the global tracking code (`reco_complete.C`) are reconstructed well. I have attached the invariant mass plots here with both the tracking codes.

Without adding Lambda Disks both tracking code performed as expected. I did not understand what is issue with the ideal tracking code.

Why D^0 's are not well reconstructed with ideal tracking code while adding Lambda Disks to rest detector system?

Can anybody teach me in this regard ??

Thanks in advance

Ajay
