Dear all,

I simulated 2k evt of this decay chain:

$p\bar{b}arp \rightarrow Ds^+ Ds^-$ ;  $Ds^- \rightarrow K^+ K^- \pi^-$ ;  $Ds^+ \rightarrow \eta e^+ \nu_e$ ;  $\eta \rightarrow \pi^+ \pi^- \pi^0$ ;  $\pi^0 \rightarrow 2 \gamma$ .

Inorder to reconstruct eta, I do mass constraint fitting on ( $\pi^+$ ,  $\pi^- \pi^0$ ) after the vtx fitting of combined charged daughters. Recently I find the probability distribution of the eta mass constraint fitting seems incorrect, where most of prob are skewed to 1 and chi2 is very small, i.e. the mean value of chi2 is 0.0003. The interesting thing is this doesn't happen in the mass constraint fittings of  $Ds^-$  (pure charged daughters) and  $\pi^0$  (pure neutral daughters). This problem is found with the release mar15 (#27529). I test the identical code with release oct14 (#26514), and find this problem doesn't arise there (see attached histograms). The code I used for testing is attached.

Question: Why it happens and how can I fix it?

Many thanks in advance.

Best regards,

Lu
