Dear Mamen,
long time ago the management of the base packages was a bit different, and it is causing your problem in the installation.
In theory, you should do the following

 * go to the pandaroot folder
 * type "svn propedit svn:externals ."
 * edit all the "base" lines (all the lines not "genfit") adding "-r 13415" before "https://..." and save -> "base -r 13415 https://..."
 * type "svn update" from the pandaroot folder
 * compile

This should link the base packages to the release 13415.

About differences, we are speaking about code of 2011, then tracking was not highly performant like now, there was no SciTil, GEMs were different as well as DIRC, no forward tracking, different beampipe, no EMC pid.
