Subject: [FIXED] Bug in Rho with "static"
Posted by Ralf Kliemt on Tue, 08 Dec 2015 08:58:25 GMT

Hi everyone,

While debugging the tree fitter a "serious bug with limited effect" was found. Basically when adding two covariance matrices (RhoError) in one line the first of them was doubled as some temporary object was static. This led to covariances of composite candidates being in the right order of magnitude but not correct non the less.

This issue is fixed as oif rev.28771.

Analysts are encouraged to update (Rho, PndTools/AnalysisTools and PndTools/PndParticleFitters)

Cheers!
  Ralf
