Dear All,

I am trying to implement different PID criteria by putting key words like as Loose, Tight, Best other then the "All" key word for my analysis.

Somehow, the implementation of different keywords does not effect my results. I had same results after implementation of all PID info key words in case of my analysis.

What should I do more to apply various PID as putting these key word does not help me.

Kindly help me in this regard.

I have attached my analysis macro and output histogram root files here.

Thanking you

Ajay
