Hello,

I tried to reinstall from the scratch, that previous issue is gone. Thanks again. But, now I have the following problem:

curl: (60) SSL certificate problem: unable to get local issuer certificate
More details here: <http://curl.haxx.se/docs/sslcerts.html>

curl performs SSL certificate verification by default, using a "bundle" of Certificate Authority (CA) public keys (CA certs). If the default bundle file isn't adequate, you can specify an alternate file using the `--cacert` option.

If this HTTPS server uses a certificate signed by a CA represented in the bundle, the certificate verification probably failed due to a problem with the certificate (it might be expired, or the name might not match the domain name in the URL).

If you'd like to turn off curl's verification of the certificate, use the `-k` (or `--insecure`) option.

```
*** Unpacking xerces-c-3.1.2.tar.gz .....  
--E-- Cannot unpack package xercesc
```

thanks and regards...
