Hello Florian and Ralph,

 thank you for your quick answers. So, as well as I understand, I am not allowed to install my own version of FairSoft or FairRoot, in Kronos, but only using those revisions which are already installed under /cvmfs/fairrot.gsi.de. I can just install myself one pandaroot revision of my "taste", and it should work. Am I correct? If yes, then I just set up the following:

SIMPATH = /cvmfs/fairroot.gsi.de/fairsoft/nov15p6_root5/
FAIRROOTPATH = /cvmfs/fairroot.gsi.de/fairroot/v-15.11c_fairsoft-nov15p1_root5/

for the release jan16. Could you please confirm that it is correct?

And now comes the question: I need to finish to run my analysis macro on some dpm old pid files, migrated from prometheus to kronos, generated in the old pandaroot release oct14. Could you please suggest for this old release which version of FairSoft and FairRoot should I set up SIMPATH and FAIRROOTPATH to?

Thanks in advance for your help,
Elisabetta
