Dear all,

We did simulations of the channel $p\bar{p} \rightarrow e^+e^-$ (at 1.7 GeV/c) with the new release of PANDAROOT (feb17). We found problems with (or we did not understand) some reconstructed variables:

1- A Peak of the reconstructed angle around 90° (Lab) (Fig.1, Fig2)

2-Deposit energy in the EMC at the transition region between barrel and forward is zero (Fig3)

Macros are from "macro/day1/" of the feb17 release.

Decay file:

Decay pbarpSystem

1.0 e^+e^- PHSP;

Enddecay

End

Thank you in advance for you help,

Alaa/Dmitry
