Hi Ana,

last time I was testing the CALIFA position, it was correctly located with respect to the nominal target position.

If this is true, the magnet is misplaced by around half a meter in this geometry file.

For a fast check to determine if CALIFA is correctly centered, you could find where the origin is in your plot or simply visualize a reaction vertex...

the CALIFA barrel should be located as it is in the attached picture (side view).

A displacement of half a meter as it is shown in your pic would mean that the vertex could be located outside the Barrel.

Regards,
