Subject: Measurement with Cd source

As discussed at Heidelberg we started making some chamber measurements with a 109Cd source as alternative to the 55Fe source and the X-ray tube. Nominal activity of the Cd source is 740MBq. The 1-d scan does not show the radiator bars as expected due to the higher photon energies of the Cd source of about 12 and 22 keV, respectively. I include a 1-d and a 2-d scan of both the X-ray tube and the Cd source for comparison.

regards

Rainer
