Hi Walter,

Can you have a look into your \$SIMPATh/lib/root directory if you have such a file?
Is \$SIMPATh/lib/root/libNet*

I guess that you have a dylib, not a .so.

I think the problem comes from the fact the DpmEvtGen/CMakeLists.txt file uses old style, and he somehow does not realise that he's on mac and should be looking for .dylib file.

As a quick solution, try to link the proper .dylib to corresponding .so file.

yours
radek
