Subject: Installing dec17 with svn and git Posted by Walter Ikegami Andersson on Thu, 15 Feb 2018 11:14:01 GMT View Forum Message <> Reply to Message

Hello everyone,

I'm trying to install pandaroot release dec17 both with the new installation method with git and in the old way with svn. I am using fairsoft_oct17p1 and FairRoot-17.10b.

First of all, on the computing wiki installation page, should one actually use fairsoft_may16p1 when installing the release? Or should it be fairsoft_oct17?

Second, when I try to compile with make, I get the following error:

CMake Error at /data/buildFairRoot-17.10b/share/fairbase/cmake/modules/GenerateVersionInfo.cmake:32 (include): include could not find load file:

/home/walan603/workspace/builddec17svn/FairRootConfigVersion.cmake

make[2]: *** [svnheader] Error 1 make[1]: *** [CMakeFiles/svnheader.dir/all] Error 2 make: *** [all] Error 2

If I copy the FairRootConfigVersion.cmake file from the FairRoot build folder to the pandaroot build folder, then it compiles. But this feels kind of sketchy...

Third, when I try to install pandaroot by checking out the project from git, I see that the pandaroot/external/vc is empty (if I checkout from svn, this folder is filled with stuff). Running cmake ../pandaroot gives following error:

CMake Error at /data/fairsoft_oct17p1/buildFairSoft/share/cmake-3.9/Modules/ExternalProject.cmake:2010 (message):

No download info given for 'vc' and its source directory:

/home/walan603/workspace/dec17git/external/vc

is not an existing non-empty directory. Please specify one of:

* SOURCE_DIR with an existing non-empty directory

* URL

- * GIT_REPOSITORY
- * HG_REPOSITORY
- * CVS_REPOSITORY and CVS_MODULE
- * SVN_REVISION
- * DOWNLOAD_COMMAND

Call Stack (most recent call first):

/data/fairsoft_oct17p1/buildFairSoft/share/cmake-3.9/Modules/ExternalProject.cmake:2565 (_ep_add_download_command) external/CMakeLists.txt:13 (ExternalProject_Add)

How do I proceed?

Walter
