Here is the abstract and the summary (attached) for the B-TOF contribution for the RICH conference.

The submission deadline is on sunday the 15th, so I would ask for feedback until saturday the 14th.

Kind regards
Sebastian

Abstract:

The barrel-Time-of-Flight detector is one of the outer layers of the multi-layer design of the PANDA target spectrometer, covering an angle of $22^\circ < \theta_{\text{lab}} < 150^\circ$. PANDA, which is being built at the FAIR facility, will use cooled antiprotons on a fixed Hydrogen or nuclei target, to study broad topics in hadron physics.

The detector is a scintillating tile hodoscope with an SiPM readout. A single unit consists of a $90 \times 30 \times 5 \text{ mm}^3$ fast plastic scintillator tile and $3 \times 3 \text{ mm}^2$ SiPM photosensors on both ends. Four SiPMs are connected in series to overcome the limited sensor size of a single SiPM sensor and to improve the time resolution drastically ($\sim 100 \text{ ps}$ to 50 ps).

While the PANDA experiment is equipped with DIRC detectors for PID of faster particles, the barrel TOF complements the setup by providing additional PID information up to $\sim 1.4 \text{ GeV}/c$ and a π/K separation of $\sim 5 \sigma$ up to the Cherenkov threshold.

In this contribution we will also review recent topics on SiPMs and compare them to MCP-PMTs.
