Hi,
I would appreciate an update of those scripts.
Quote:What about prompt and/or directory highlighting? Anybody who dislikes it? Does it work with windows SSH clients?
Some common aliases?

Testing with
 export PS1="\[\033[1m\]$PS1\[\033[0m\] " #bold
I see no problems on windows "SSH secure shell"

Concerning alias, I propose something for this ls version
 ls --color=never

Last point, "common GSI login scripts"
I opt against this, i.e. rootlogin, because not everybody uses it.
Those who have to use it can include it in their own "profile".

Peter
