Dear all,

because of the memory consumption of ALICE jobs:
please contact also W. Schoen. He monitored the memory consumption on the batch farm machines with some tool of his. According to my memory we had a peak consumption of something like 4-5 GB during reconstruction, I believe, and an average memory consumption of around 2 GB. For sure our finding was, that with the peak memory consumption we could not run safely two jobs at the same time on a 8 GB RAM machine, assuming that they could reach their peak within the same time slot. I discussed that many times with Walter.

Cheers,

Kilian
