hi Ralph

I have taken a look into your updated
mvd directory, specially in the tst directory.

You told me once, that the microstrips can be
implemented by using the pixel class as well.
But i don't see any special selection for strips
calculation in `CbmStsHitProducerIdeal(lx,ly,thresholod,noise)`.

When one call the `CbmStsHitProducerIdeal(lx,ly,thresholod,noise)`
in the `/macro/mvd/runTSTAnaDigi.C`, and specifies the values of lx, and ly, you define only
pixel in this way, or I'm wrong ?.

If it is correct, where do you specify if you have double sided
layer or if you have only one strips layer?

Sorry if that are so naive questions.

thanks a lot
