Hi Stefano

I found the problem. cmake is looking in the GEANT4 directory for a file env.sh which contains all the settings used for building GEANT4. If you use the tarball from GSI this file should be in that directory. If you have installed GEANT4 on your own than you should look in the following subdirectory for this file .config/bin/Linux-g++. Please copy this file to the GEANT4 directory and the everything should work.

Ciao

Florian
