Hi,

you do not really need the SetEnv.sh any more, all you need is the SIMPATH, So you can do
export SIMPATH=(path to external packages i.e. cbmsoft/)
then continue as Ralf described:

```
cbmsoft/cbuild>cmake ../pandaroot
```

Load the local enviroment.

```
cbmsoft/cbuild>. config.sh
```

Begin compiling:

```
cbmsoft/cbuild>make install
```

Notes

To run your macros on this build you have to load the cbuild/config.sh
