I wrote a small example how to use the dashboard in the Wiki:
<http://panda-wiki.gsi.de/cgi-bin/view/Computing/PandaRootDashboard>

and the Link to the dashboard is:
<http://lxg1417.gsi.de:8081/PandaRoot/Dashboard>

Quote:Setting up a Nightly Build

To have a nightly build of Pandaroot on your local computer you have to set up the Dart.sh script and add its execution to your crontab. I prefer to have the nightly build separated from my own development, so I made a second checkout of pandaroot and a new build directory.

In cbmsoft/dart-src/Dart.sh

```
export SIMPATH=/home/ralfk/cbmsoft
export BUILDDIR=/home/ralfk/cbmsoft/pnd-dart
export SOURCEDIR=/home/ralfk/cbmsoft/pnd-dart-src
export LINUX_FLAVOUR=openSUSE-10.2
```

and crontab -l (use -e to edit)

```
#min hour day month dow command
0 2 * * * /home/ralfk/cbmsoft/pnd-dart-src/Dart.sh Nightly
```

If there are any points of discussion on this, feel free to put it here.

Ralf.
