Hi,

fortunately I still have the svn output in my shell buffer:

```
dallas $ pwd
```

```
/home/knucl/FAIRroot/PANDARoot
```

```
dallas $ svn co https://subversion.gsi.de/fairroot/pandaroot
```

```
U pandaroot/stt/CbmStt.cxx
```

```
U pandaroot/stt/CbmSttHitProducerIdeal.cxx
```

```
Fetching external item into 'pandaroot/base'
```

```
Checked out external at revision 1114.
```

```
Fetching external item into 'pandaroot/cbm4'
```

```
Checked out external at revision 1114.
```

```
Fetching external item into 'pandaroot/config'
```

```
svn: 'pandaroot/config' is not a working copy
```

```
dallas $
```

```
dallas $ ls
```

```
build  cbuild  pandaroot
```

The output looks like my everyday svn output and therefore I do not think that there is a svn conflict. Do you have any other hints on how I might restore the missing cmake/modules directory?
