Thanks a lot,

for this completely non-sarcastic reply. Of course I am a daily user of svn and know the program. I have also tried the default "I have no clue whats going on" solution - and updated pandaroot to the newest version.
However I have to admit that I was confused that you referred to the latest pandaroot version as svn head version. I personally would call the latest pandaroot version or pandaroot head version if you like, and the latest version of SVN, latest SVN version or SVN head version if you prefer. Now you see where the confusion came in...

In absence of better ideas I will try todays revision as well, but I agree with Stefano and do not think it is a problem with revisions.
