Dear all, the tof detector(start(fibers) + stop(barrel))
has been added to pandaroot.

It contains

start detector as a two fiber scintillator planes
placed around the hypernuclei secondary target.

Stop detector as a barrel geometry which has been designed
by using the TPR parameters.

Pay attention that It still is a very preliminar design.

It only provides a smeared start and stop time.

The geometry is not yet optimized:

it doesn't present any hole for the pellet target.

SO wait a little bit to load it.

further changes are forseen this week.

best regards

Alicia S.
