Dear Ralf, and Tobias,
i have already implemented the digitization for the hyp detector
by taking your HybridHit Producer as example.
I have modified the way in which the row and the colums (pixels) are defined, that means, i
have considered when the local system of my layers are in the x-Z or in the Y-Z plane defined,
while your local system is in the X-Y plane defined.
Ok, the point is that
i don't really understand whether it is right or not what i obtain;
Is it possible to send my result to you in order to know if what i'm getting it's Ok or not?

thanks in advance.
Alicia S.
