Hi Tobias, the reason for the change was:

a.) George's field maps were quite large.

just to give numbers: a compressed tar file (e.g. rev 246)

was 118 MB compared to nowadays 16.2 MB.

b.) these "official" field maps are maintained together with the GSI integration group (current version of March 2007)

c.) there is a correct description (i.e. adding of B fields) of the field in the transition region between the solenoid and the dipole.

(and it was O.K. for George that we did the change).

best regards, Soeren
