Dear all,

I removed from the main makefile the libraries stt1 stt2 fsc and bfield, and I added stt (that was missing before) and tof.

Even the Dart.sh file should be updated.

I will keep them for another week, then I will delete them.

Stt package was never compiled before under Dashboard, so all the deprecated warings are still there.

There are 19 warnings still existing, could you please remove them? I could do it, if you agree, but there is one warning (the last one) that I could not understand.

Thanks
