Subject: Elastic scattering in DPM generator

Dear PandaRooters,

I try to do some simulations to estimate the hit rate the MVD is facing during pbar-p operation of the experiment. Therefore I used DPMGen to generate the initial particles with the different options with and without elastic scattering. But it seems to me that the generator creates exactly the same files independent of the option you choose (only elastic, only inelastic, both). Even the size of the files is identical.

Has somebody else observed the same problems or can comment on it?

Thank you,

Tobias
