Subject: Problem with cmake
Posted by Andrea Fontana on Thu, 27 Sep 2007 07:47:00 GMT

Hello everyone,
   I have a problem compiling with cmake on the current svn
version of pandaroot. I follow the standard procedure:

mkdir build
cd build
cmake ../../pandaroot
. config.sh
cmake install

but on the last step I get this error:

home/andrea/cbmsoft/pandaroot/build > cmake install
CMake Error: The source directory "/home/andrea/cbmsoft/pandaroot/build/install" does not
exist.
Specify --help for usage, or press the help button on the CMake GUI.

I tried this on two machines with the same effect.
Things were working until last friday, when I did my last update.

Any idea?

Ciao,
Andrea
